Abstract

Rich article introductions rendered at build time, with portable links, isolated anchors and verified dependencies.

We can now select a rich introduction with `.. more::`. Native postlists and collection templates preserve paragraphs, **emphasis**, links, lists and lead images during the build. The full article retains its complete content in HTML and PDF.

We render collection introductions through `post.excerpt_html` and native listings through `.. postlist::` with `:excerpts:`. Articles without a boundary keep the plain-text summary fallback. Feeds and description metadata continue to use `:summary:` independently.

Excerpt links and resources are relative to their destination, including nested taxonomy archives and pagination. Repeated native listings use separate anchor namespaces. References to targets and footnotes beyond the boundary lead to the full article. Listings retain source-scoped reference and asset dependencies, and included-file edits rebuild them.

This fixes issue 3. We describe authoring, templates and Tinkerer migration in the static publishing guide. The release also includes the SSG corrections and custom-directive documentation reviewed after beta.6. Every platform archive exercises rich excerpts in its complete SSG smoke test.
